INTRODUCTION

This document contains water consumption data for the majority of Saskatchewan municipalities from 2000 to 2014. The information includes Saskatchewan Ministry of Health population statistics, monthly, yearly, average day, peak day and per capita water consumption as well as peak day factors. For 2014, The Water Security Agency obtained water consumption records from 590 communities or agencies. Data for most of the First Nations was not available at the time of publication. This document will be updated on an annual basis.

For the 2014 calendar year, the Water Security Agency requested both Raw (untreated) and Treated water volumes. 157 communities provided both measures, enabling us to analyze usage in ways not previously possible. For this report, raw-water volumes were selected where available. This may inadvertently suggest significant increases in actual usage, which is rare.

Where community water usage records do not exist or data as obtained appears to be erroneous, the average water demands of between 230 and 450 litres/capita/day (LCD) could be used. Some comments on questionable and/or missing data are included in Appendices A and B. The provincial weighted average and provincial average as shown are based on communities having water consumption in the range of 130 to 750 LCD.

It should be noted that the litres/capita/day (LCD) for some communities such as Resort Villages and First Nations may be misleading because the population may not reflect the actual users. It should also be noted that the peak day water consumption shown for each community (one-day occurrence in a year) is for information only and may be used for design purposes with caution. Sometimes this peak day water consumption data could be exaggerated due to a water main break, fire demand or other problem with the treatment or distribution system.

When communities report their peak day consumptions, occasionally questionable data is reported; this can be due to various reasons. For example, some communities may have more than one water meter. Other communities do not monitor their daily consumption. Such examples illustrate why peak day consumptions to be used in design purposes should be used with caution, as questions can be raised as to where the peak day data originates. In the case where questionable peak day data exists, the table located on the next page has been provided for reference.

Further to this, some communities continue to report very low peak day consumptions. The reason for this low reporting has not yet been discovered. For this reason, some low peak day factors may still be found within this document but these data remain questionable.

For design purposes, water supply and treatment facilities serving municipalities with a population under 10,000, the peak day demand may be taken as two to three times the average rate. A peak hour factor of three to four would apply for distribution pumps. The table on the following page may be utilized for peaking factors for various sized communities.

The water type (Raw/Treated/Unknown) shown in this report next to the year for each record, indicates the type of water measured for that year. The population statistics for First Nations from 1998 onward have been provided by the Saskatchewan Ministry of Health where the statistics are available. A zero (0) does not necessarily indicate that no water was consumed, but that water records may not have been available.

RECOMMENDED PEAKING FACTORS FOR MUNICIPAL WATER SUPPLY SYSTEMS		
Population Range	Peak Day Factor (For Supply and Treatment)	Peak Hour Factor (For Distribution)
Up to 500	3.00	4.50
501 - 1,000	2.75	4.13
1,001 - 2,000	2.50	3.75
2,001 - 3,000	2.25	3.38
3,001 - 10,000	2.00	3.00
10,001 - 25,000	1.90	2.85
25,001 - 50,000	1.80	2.70
50,001 - 75,000	1.75	2.62
75,001 - 150,000	1.65	2.48
Greater than 150,000	1.50	2.25

¹The LCD (litres/capita/day) is computed by summing the LCD for each community and dividing by the number of communities.

²The Weighted LCD (litres/capita/day) is computed by summing the yearly water consumption for each community and dividing by the total population and 365 (days).
